

Overview:

In this project, you will work with a dataset containing operational data from multiple airlines. Based on the client's requirements, you are expected to perform detailed analytical tasks to derive meaningful insights from the data.

The analysis will focus on airline operations across various departure and arrival airports. It will include evaluating flight performance over a specific period, examining average delay times, and identifying operational trends. The objective is to provide actionable insights related to flight status, airline efficiency, and air traffic patterns.

Output:

The output should look like following:

1. Flight Status Analysis:

Overview of flights categorized as On-Time, Delayed, and Cancelled.

Monthly and airline-wise performance comparison.

Average delay time analysis.

2. Air Traffic Analysis:

Identification of peak traffic hours.

Insights into the best time to book flights.

Analysis of periods with maximum flight availability.
